## Note: Revision History

Revision	Date	Comment
V1.0	2018-11-22	First release

## 1. Descriptions

SA868 is a cost-effective integrated professional walkie-talkie module, built-in high-speed microcontroller, high-performance RF transceiver chip and RF power amplifier, and provides a standard serial port to communicate with the module, so that the module's related parameters can be set quickly and easily. Function control. Users only need to connect an audio amplifier, microphone, and speaker to this module to work as a small walkie-talkie. The simplified interface and ultra-small size make this module widely available, and can be easily and quickly embedded in various handheld devices to improve the overall performance of the terminal products.

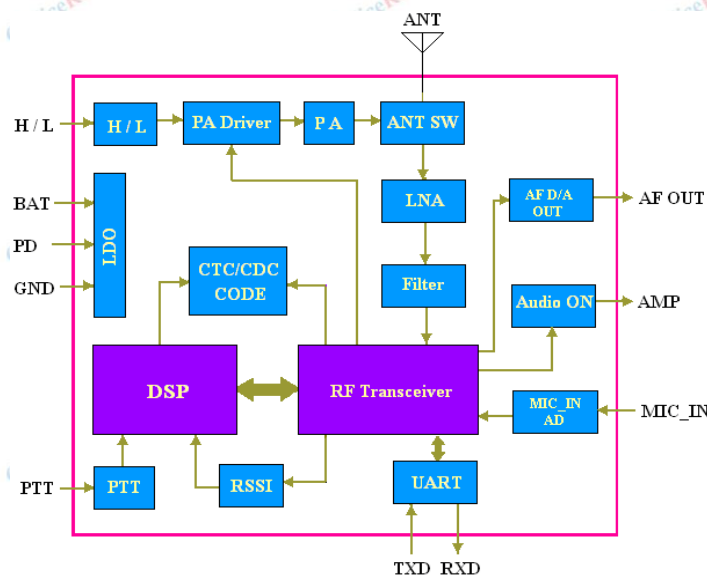

## 2. Features

- UHF band 400~480 MHz
- Transmit receive frequency independent
- Bandwidth 12.5 KHz
- RSSI signal strength indication
- Open distance is 5 kilometers
- High receiving sensitivity: -124 dBm
- Highly integrated small volume
- 38-level CTCSS analog sub-audio code
- 166-level positive phase, inverted CDCSS digital sub-audio
- 8-level squelch
- 8-level adjustable volume
- High and low power options (1.6-1.8W)
- Wide operating voltage 3.3-5.5 V
- Built-in EEPROM, data power-down save
- Stable with 1ppm TCXO crystal

## 3. Application

- Small walkie talkie
- Ignore the intercom system
- Building community security system
- Outdoor sports products
- Audio monitoring system

## 4. Internal block diagram

## 5. Specification

Parameter	Test condition	Min	Typ.	Max	Unit
Power supply		3.3	4.2	5.5	V
Working Temperature range		-30	25	70	°C
<b>Current consumption</b>					
Sleep current			≤1		uA
RX current			60		mA
TX current (High power)			900	950	mA
TX current (low power)			450	550	mA
<b>Transmitting RF parameters</b>					
Frequency range	UHF	400		480	MHZ
Out power (high power)	@VCC=4.0V	31	32.5	33	dBm
Out power (low power)		24	25	26	dBm
Modulation frequency	@1.5Khz/2.5KHZ Frequency offset		10		mV
Audio modulation distortion	@1.5Khz/2.5KHZ Frequency offset		2	5	%
SignaltoNoiseRatio	@1.5Khz/2.5KHZ Frequency offset	38	40	45	dB
adjacent-channel power	@12.5K offset		-60dBc		dBm
CTCSS Modulation frequency		0.35	0.5	0.75	KHZ
Modulation frequency	UHF	400		480	MHZ
<b>Receiving RF parameters</b>					
Receiving sensitivity	13dB Output voice signal ratio		-124		dBm
Receiving SNR	@1.5KHZ Frequency offset	45	50		dB
Audio output amplitude			700		mV
Audio Output impedance			200		OHm

## 6. Typical Application Schematic

## 7. Communication protocol

The module provides a good user interface (standard serial port), the user can send commands through the serial port to adjust and read the module parameters. The memory is integrated inside the module, and the related parameters of the configuration can be stored.

Instruction transmission format:

All instructions start with "AT" and end with <CR><LF>.

After the module is running, the standard settings of the communication serial port are:

Rate: 9600 bps    Data bits: 8 bits    Stop bits: 1 bit    Parity: None

➤ Instruction return format:

Returns a string associated with the send instruction, ending with <CR><LF>.

➤ Frame format definition:

All instructions in the communication protocol are transmitted in ASCII.

Terminal to module communication takes the form: AT+DMOXXX

The module adopts the form of terminal communication: +DMOXXX (Note: the terminal does not need to return)

---

## Instruction description

### ➤ AT+DMOCONNECT Handshake instruction

Description: The handshake instruction is intended to prove that the module is connected and operating normally. Each time the terminal sends it, the module returns after receiving this command.

Repeat response command; if the 3 handshake command does not receive the module response, the terminal should restart the module.

Format: AT+DMOCONNECT

Example: AT+DMOCONNECT

### ➤ +DMOCONNECT Handshake response command

Description: The module handshake response command, the module must respond to the first time after receiving the DMOCONNECT command.

Format: +DMOCONNECT:0

Example: +DMOCONNECT:0

Parameter X description: 0 → Normal working status

### ➤ S+Sweep command

Description: Set the frequency to scan.

Format: S+scanRF

Example: S+455.2250

Parameter description:

scanRF: the frequency to scan

### ➤ S=Sweep response command

Description: Sweep response command, the module will sweep the frequency after receiving the sweep command, sweep the frequency and return to the sweep result.

Format: S=X

Parameter description:

0 → The frequency to be scanned has a signal

1 → There is no signal to sweep the frequency

 **AT+DMOSETGROUP Set group instruction**

Description: Set the working parameters of the module.

Format: AT+DMOSETGROUP=GBW, TFV, RFV, Tx\_CXCSS, SQ, Rx\_CXCSS

Example 1: AT+DMOSETGROUP=0,415.1250,415.1250,0012,4,0013

Example 2: AT+DMOSETGROUP=0,415.1250,415.1250,754N,4,445I

Parameter Description:

GBW: Bandwidth setting (0: 12.5K 1: 25K)

TFV: Transmit frequency value (134.0000M~174.0000M,400.0000M~480.0000M)

RFV: Receiving frequency value (134.0000M~174.0000M,400.0000M~480.0000M)

(Note: The transmission frequency and reception frequency can be the same or different, but the set frequency must be 12.5K and 25K.Integer multiple)

Tx\_CXCSS: TX CXCSS Value

SQ: Squelch level(0~8) (0: Monitor mode, scan mode cannot be used 0)

Rx\_CXCSS: RX CXCSS Value

(Note: different CXCSS values can be used for transmission and reception, 0000: no coding 0001-0038: CTCSS After the letter: CDCSS, the code is shown in the attached table 1)

 **+DMOSETGROUP Set group response command**

Description: After receiving the setup group command, the module returns the operation result.

Format: +DMOSETGROUP:X

Example: +DMOSETGROUP:0

Parameter X description:0 → Success, 1 → Data setting is out of range

 **AT+DMOSETVOLUME Set the volume command**

Description: Set the volume level of the module

Format: AT+DMOSETVOLUME=X

Example: AT+DMOSETVOLUME=1

Parameter X description:The volume level parameter ranges from 1 to 8

➤ **+DMOSETVOLUME** Volume setting response command

Description: Set the module's volume level result response

Format: +DMOSETVOLUME:X

Example: +DMOSETVOLUME:0

Parameter X description: 0—>Set successfully 1—>Setup failed

➤ **AT+RSSI** Read signal strength command

Description: Read the signal strength of the module

Format: AT+RSSI? Example: AT+RSSI?

➤ **RSSI=XXX** Read signal strength response command

Description: Read module's signal strength result response

Format: RSSI:XXX

Format: RSSO:010

Parameter X description: Current signal strength value, the larger the value, the stronger the signal strength

➤ **AT+SETFILTER** Set filter instructions

Description: Set the filter of the module

Format: AT+SETFILTER=PRE/DE-EMPH,HIGHPASS,LOWPASS

Example: AT+SETFILTER=0,0,0

Parameter description: PRE/DE-EMPH,0 means pre-emphasis/de-emphasis on, and 1 means pre-emphasis/de-emphasis off;

HIGHPASS, 0 means the high-pass filter is on, and 1 means the high-pass filter is off;

LOWPASS, 0 means the low-pass filter is on, and 1 means the low-pass filter is off;

➤ **+DMOSETFILTER** Filter setting response command

Description: Set the module's filter result response

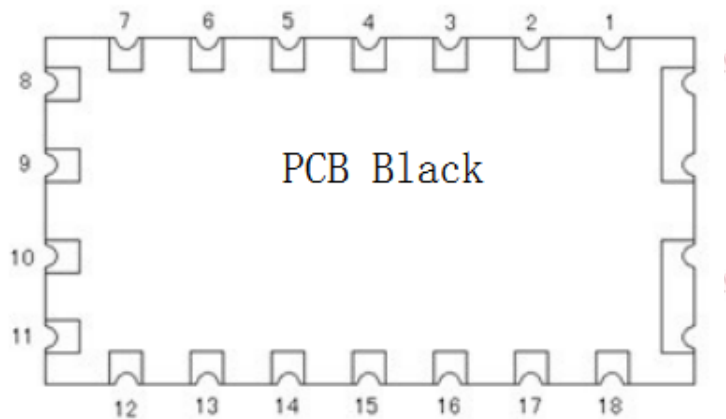

Format: +DMOSETFILTER:X

Example: +DMOSETFILTER:0

Parameter X description: 0—>Set successfully 1—>Setup failed

## 8. Pinout definition

Pin NO.	Pin name	I/O state
1	Audio ON	Connected to audio power amplifier. When the module worked, it can control the extra audio amplifier automatically, it will output low level to turn on the amplifier and high level to turn off the amplifier.
2	NC	Not connected
3	AF_OUT	Audio output
4	NC	Not connected
5	PTT	Module Input, Transmitting/receiving control, "0" force the module to enter TX state; and "1" to Rx state
6	PD	Power Down control, "0" for power down mode; "1" for the normal work
7	H/L	high/low output power control; Leave open for high output power, low level to low output power. (Please kindly note: this pin can NOT be connected to VDD or high level of cmos output)
8	VBAT	Connect power positive
9	GND	Grounding
10	GND	Grounding
11	NC	Not connected
12	ANT	connect 50 ohm antenna
13,14,15	NC	Not connected
16	RXD	RXD of the module and connect to external TXD
17	TXD	TXD of the module and connect to external RXD
18	MIC_IN	Microphone or line in

## 9. Mechanism Dimension

## 10. FAQ

- a) Why module can not communicate properly?
  - 1) Check if there is power connection error;
  - 2) Check if Module is in normal communication mode;
  - 3) Check if frequency, channel, and mute are same;
  - 4) Check if module is damaged;
- b) Why transmission distance is not far as it should be?
  - 1) Power supply ripple is too large;
  - 2) The antenna types do not match, or not installed properly;
  - 3) The same frequency interference;
  - 4) The surrounding environment is harsh, strong interference sources.

## Appendix 1: DEMO Board

In additional, we provided DEMO Board for customers to debug the software program, test all the function and measure the distance. The figure shows as below:

User can set related parameters through the buttons:

- 1) Tx frequency: 400 ~ 480 MHz
- 2) Rx frequency: 400 ~ 480 MHz
- 3) Channel Bandwidth: 12.5 KHz / 25KHz
- 4) CTCSS: 0 ~ 38
- 5) CDCSS: 0—166
- 6) Squelch: 0 ~ 8
- 7) Volume: 1 ~ 8

### ➤ Button Operation:

- 1) SET button  
Press to enter setting mode.
- 2) UP /Down button  
In setting mode, press to increase/decrease the setting item.
- 3) PTT button  
If Not in setting mode, Press to talk,( Listen state when released)
- 4) High/Low slide switch  
Switch to high/low output power

**Note: With data FLASH inside, all the setting parameters are saved and keep unchanged even power off.**

## Appendix 2: Mute on the interface display and send correspondence tabl

★Note: The N code is encoded as the corresponding I code code bitwise inversion, such as 023N code is 023I code bitwise negation:

$$023N = \sim 023I = 00110111111000111001000$$
